ID	Risk	Mitigation and what happened	State
R1	Too much new code in too little time	Occurred in part: 77 commits in four days. Mitigation: ownership, small pull requests, CI, tests, decision records; each member explains their own code	Residual
R2	Graph unavailable	Compose smoke test; health endpoint reports the real mode	Mitigated
R3	Live model or key unavailable	503 and failure screens; occurred on staging (empty explanations)	Open
R4	Different JSON assumptions between owners	Contract freeze and recorded fixtures; one miss (UUID versus tail number) fixed	Mitigated
R5	Merge conflicts from several people and tools	One owner per file, hand-off decisions, small pull requests	Mitigated
R6	Exposed secrets	Secrets only in ignored files; audit by Usman; `.env.local` was found not to be in `.gitignore` and must not be committed	Residual
